IRON REMOVER

Multi-Media Filters are the most well-known solution to remove iron from water. This system is known for its ability to remove iron, turbidity, odors, color, and suspended particles to produce high-quality water. These filters consist of multiple graded membrane layers arranged from largest to smallest in grain size to enable efficient filtration of larger particles followed by smaller particles.

WATER SOFTENER

Water softening is the removal of calcium, magnesium, and certain other metal cations in hard water. The resulting soft water requires less soap for the same cleaning effort, as soap is not wasted bonding with calcium ions.
